A student needs a simple weekly planner system to keep track of their weekly schedule. Foe each day the planner should store: name of the day (eg., Monday, Tuesday,....), date of the day (numeric format) and the activity planned for that day (eg. , class, event, meeting). Develop a C program to implement this weekly planner using the following functions. a. create() to initialize the weekly planner. b. read() to input the details (day name, date, activity) from the user. c. display() to generate and print the weekly activity report on screen.

```
#include <stdio.h>
#include <stdlib.h>
#define MALLOC(p,n,type)\
{\
p=(type*)malloc(n*sizeof(type));\
if(p==NULL)\
{\
printf("Insufficient Memory\n");\
exit(0);\
}\
}

typedef struct{
   char *dayName;
   char *date;
   char *activity;
}Day;

void create(Day *calendar) {
    int i;
   for (i = 0; i < 7; i++) {
      MALLOC(calendar[i].dayName,20,char);
         MALLOC(calendar[i].date,20,char);
      MALLOC(calendar[i].activity,100,char);
      }
   }

void read(Day *calendar) {
   int i;
   for (i = 0; i < 7; i++) {
      printf("Enter the name of the day for day %d: ", i + 1);
      scanf("%s", calendar[i].dayName);

      printf("Enter the date for day %d: ", i + 1);
      scanf("%s", calendar[i].date);

      printf("Enter the activity description for day %d: ", i + 1);
      scanf(" %[^\n]s", calendar[i].activity);
   }
```

```
}

void display(Day *calendar) {
    int i;
    printf("Weekly Activity Report:\n");
    for (i = 0; i < 7; i++) {
        printf("Day %d:\n", i + 1);
        printf("Day Name: %s\n", calendar[i].dayName);
        printf("Date: %s\n", calendar[i].date);
        printf("Activity: %s\n", calendar[i].activity);
        printf("\n");
    }
}

int main() {
    Day *calendar;
    int i;
    MALLOC(calendar,7,Day);
    create(calendar);
    read(calendar);
    display(calendar);
    for (i = 0; i < 7; i++) {
        free(calendar[i].dayName);
        free(calendar[i].activity);
        free(calendar[i].date);
    }
    return 0;
}
```
